

Task 14 – Basic Sales Summary

Data Analytics Internship – Task Explanation Report

1. Objective

The objective of this task was to create a basic sales summary using Excel by calculating total sales, average sales, and transaction count, and presenting these as three key performance indicators (KPIs).

2. Dataset Used

The Superstore dataset was used. It contains sales transaction records and includes a Sales column that can be used to calculate the required KPIs.

3. Tool Used

Microsoft Excel

4. Work Completed

- Opened the Superstore CSV dataset in Excel.
- Created a separate Summary worksheet.
- Created a KPI table with Total Sales, Average Sales, and Transaction Count.
- Used Excel formulas to calculate each KPI.
- Formatted currency values and transaction count.
- Added borders and basic formatting to make the summary sheet clear and readable.
- Verified that the transaction count matched the dataset records.

5. Excel Formulas

KPI	Formula
Total Sales	=SUM('SampleSuperstore(1)'!J2:J9995)
Average Sales	=AVERAGE('SampleSuperstore(1)'!J2:J9995)
Transaction Count	=COUNT('SampleSuperstore(1)'!J2:J9995)

6. Final KPI Results

KPI	Result
Total Sales	\$2,297,200.86
Average Sales	\$229.86
Transaction Count	9,994

7. Key Learning

This task provided practical experience in using Excel formulas for basic sales analysis, building a KPI summary, checking transaction counts, and presenting business information in a concise format.

8. Deliverable

A formatted Excel Summary sheet containing three KPIs: Total Sales, Average Sales, and Transaction Count.
